

Progress Report # 4

Date: March 30, 2025

Prepared by: Charlie Medialdea (300374504)

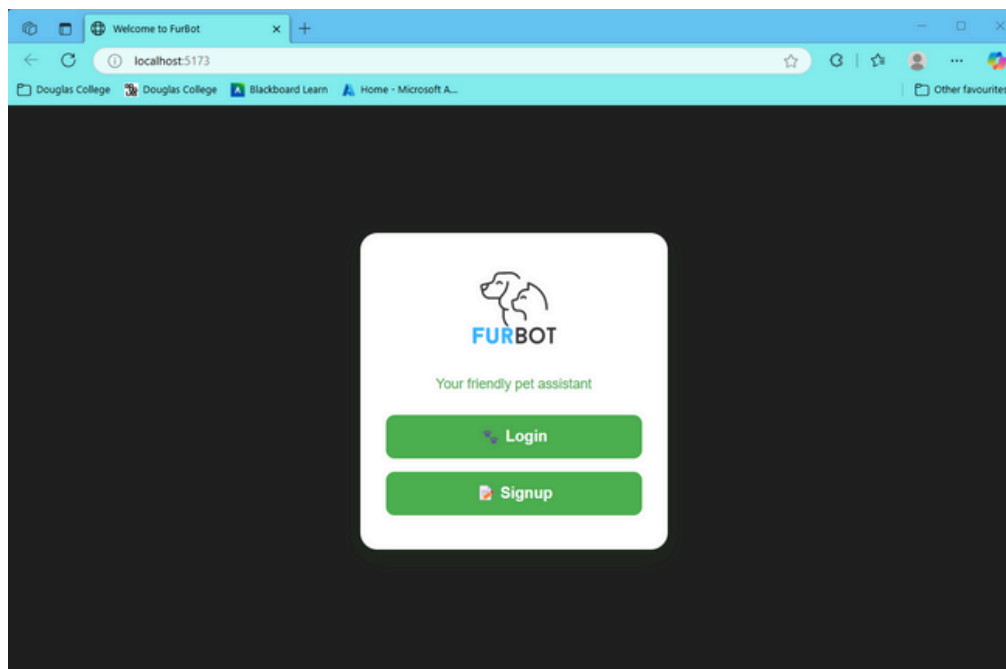

Sprint 7 Progress (Progress Report 4):

During Sprint 7, I made continued progress on key features, including:

- Implemented an email reminder functionality for users.
- Enhanced the user interface with an improved theme for a better user experience.
- Added a new chatbot intent to expand conversation capabilities.

Enhance user interface:

Progress Report # 4

Auto email reminder:

Pet Profile

Ommi

Species: Dog
Breed: Golden Retriever
Color: Brown
Birthdate: 2019-03-05
Age: 6

Delete Pet

+ Add Reminder

dd-yy-yyyy

Reminder Type (e.g. Vet Visit, Vaccine)

Notes (optional)

*** This email appears to originate outside of Douglas College. ***

Hello medialdeac@student.douglascollege.ca,

This is a reminder for Ommi's Vet Visit today.
Notes: Annual check up

Regards,
Furbot

Enhance chatbot intent:

FurBot Chat

Hi! I'm FurBot — I can help with pet travel, finding vets & groomers.

Try asking:

- How to bring my dog to Canada?
- What airlines allow dogs?
- Find groomers near me

Can I bring my dog to USA?

To take a dog from Canada to the United States, your dog must appear healthy and may require a valid rabies vaccination certificate. Check the latest guidelines from the [CDC website](#).

Airlines that allows dogs

Some international airlines that allow small dogs in the cabin include: Air Canada, Lufthansa, Korean Air, and Delta. However, airlines like Singapore Airlines and ANA only allow pets in cargo for international travel. Always confirm with the airline before booking. For a full list and updated policies, visit the [Condé Nast Traveler article](#).

bring your dog to canada

To bring a dog into Canada, your dog must have a valid rabies vaccination certificate. Puppies under 3 months are exempt. Always check the latest guidelines from the [CFIA website](#) or your airline.

Progress Report # 4

I attempted to deploy FurBot to production again, this time separating the backend (deployed via Railway) and the frontend (hosted on Netlify). Both deployments were successful; however, I'm still encountering issues related to CORS, which are preventing proper communication between the two.

To address this, I added several troubleshooting mechanisms, including logging to verify that the correct environment variables are being loaded and that the API endpoints are being accessed as expected. Below are some screenshots that highlight the current status and debugging steps.

Deployment Logs

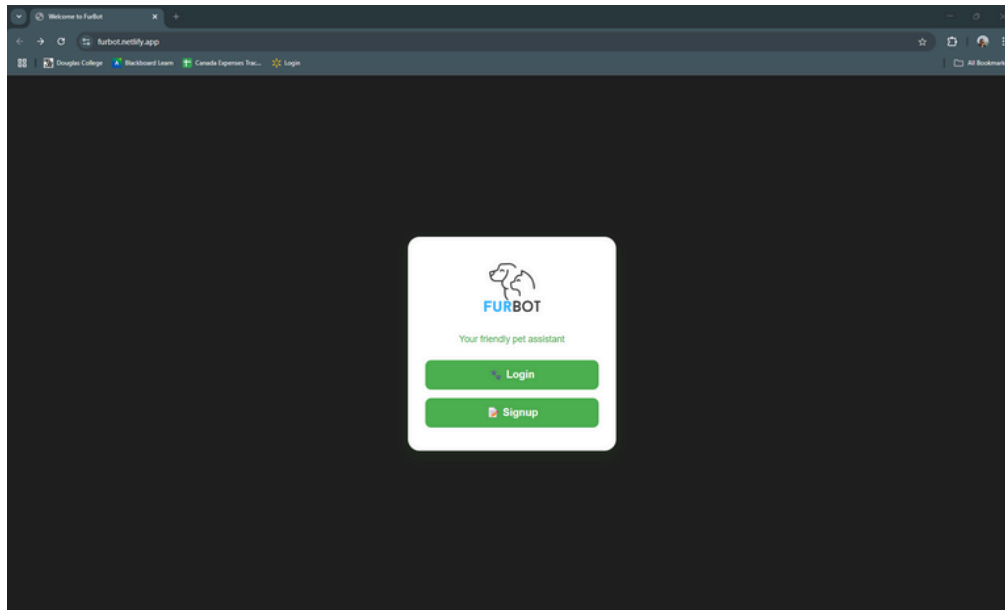

The screenshot shows the deployment logs for the application 'furbot-production.up.railway.app'. The logs are displayed in a dark-themed interface with a search bar and tabs for 'Details', 'Build Logs', 'Deploy Logs', and 'HTTP Logs'. The 'Deploy Logs' tab is selected, showing a list of log entries with timestamps and messages. The logs indicate the container starting, the application listening on port 8000, and the registered routes for the API.

Progress Report # 4

Production Screen

Despite trying various strategies and solutions found online, I continued to encounter the same error.

Progress Report # 4

What's Next:

To further enhance personalization, FurBot will implement a proactive suggestion system that learns each pet's routine over time. By analyzing reminder schedules and chatbot interactions, FurBot will be able to intelligently suggest timely actions to pet owners—such as prompting for a grooming reminder once a certain period has passed since the last one.
